

## Limitations

The main limitation I noticed is that the data can either be missing for specific columns, or a numbered value can be extremely far from a realistic number. For example, there are GPA values that exceed 4 (the highest in my dataset was 29.6), which are invalid. It would be prudent for the website developer to include some validations in the applicant responses.

Overall, the responses didn't surprise me. The one that I thought was interesting though, was that the average GPA of accepted applicants was 3.58 while the average GPA for American students was 3.63. This makes me conclude that International students are admitted on average with lower GPAs.
