Dependency Graph

The [app.py](app.py) file has two main dependencies: Flask and the query_data.py file. The Flask dependency is the largest, which is used to create a Flask app and define one endpoint at the root, rendering the index.html file. Query_data.py is used to make the requests to the database for the data to be rendered. There is a third dependency of psycopg2, which is heavily used in query_data.py, as it handles the database connection.
